This gene encodes a member of the R-spondin family of proteins that share a common Background:

domain organization consisting of a signal peptide, cysteine-rich/furin-like domain, thrombospondin domain and a C-terminal basic region. The encoded protein may be involved in activation of Wnt/beta-catenin signaling pathways. Mutations in this gene are associated with anonychia congenital. Alternate splicing results in multiple transcript

variants.[provided by RefSeq, Sep 2009],
